

# Capsis / AMAPstudio

The benefit of integrative software platforms for models mutualisation  
and chaining

Francois de Coligny (INRA AMAP)  
Sébastien Griffon (Cirad AMAP)

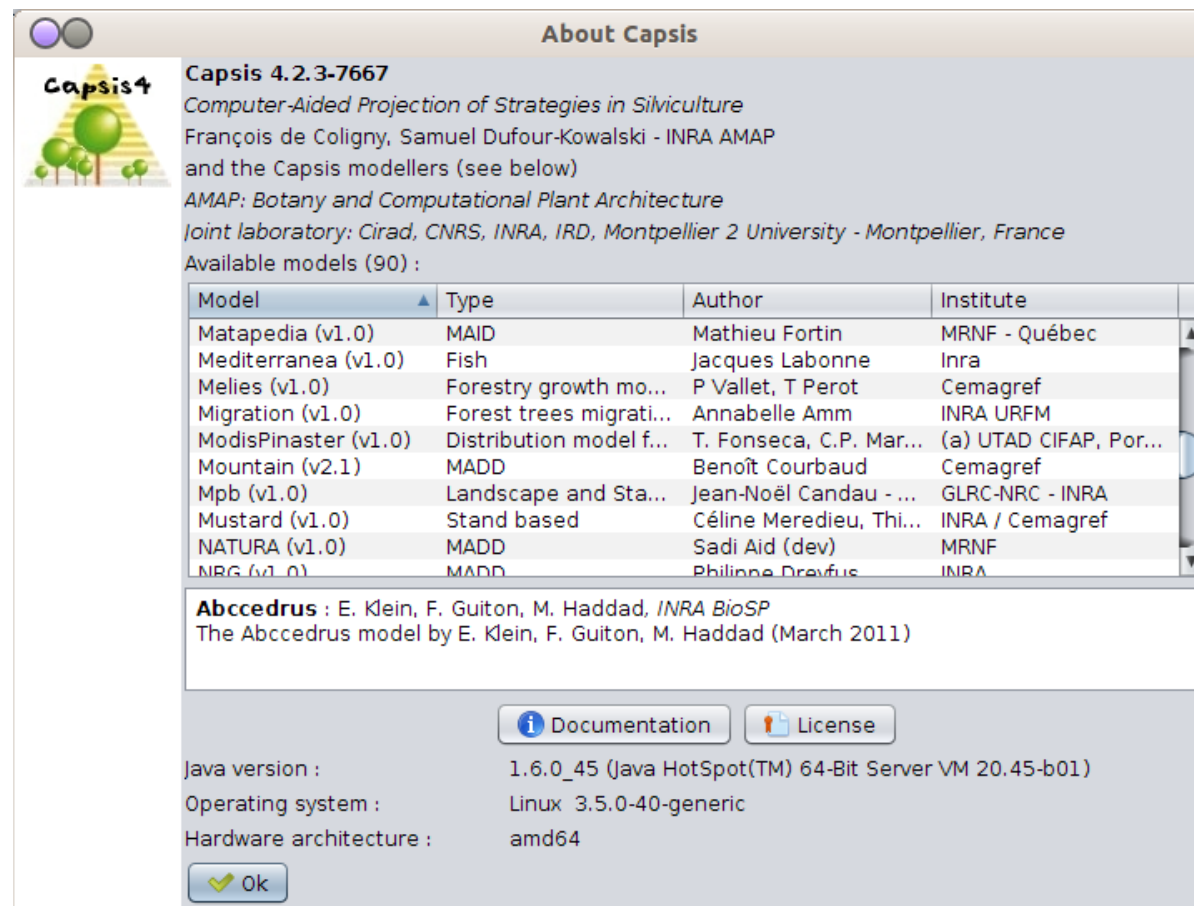

AMAP - Botany and Computational Plant Architecture  
Montpellier, France

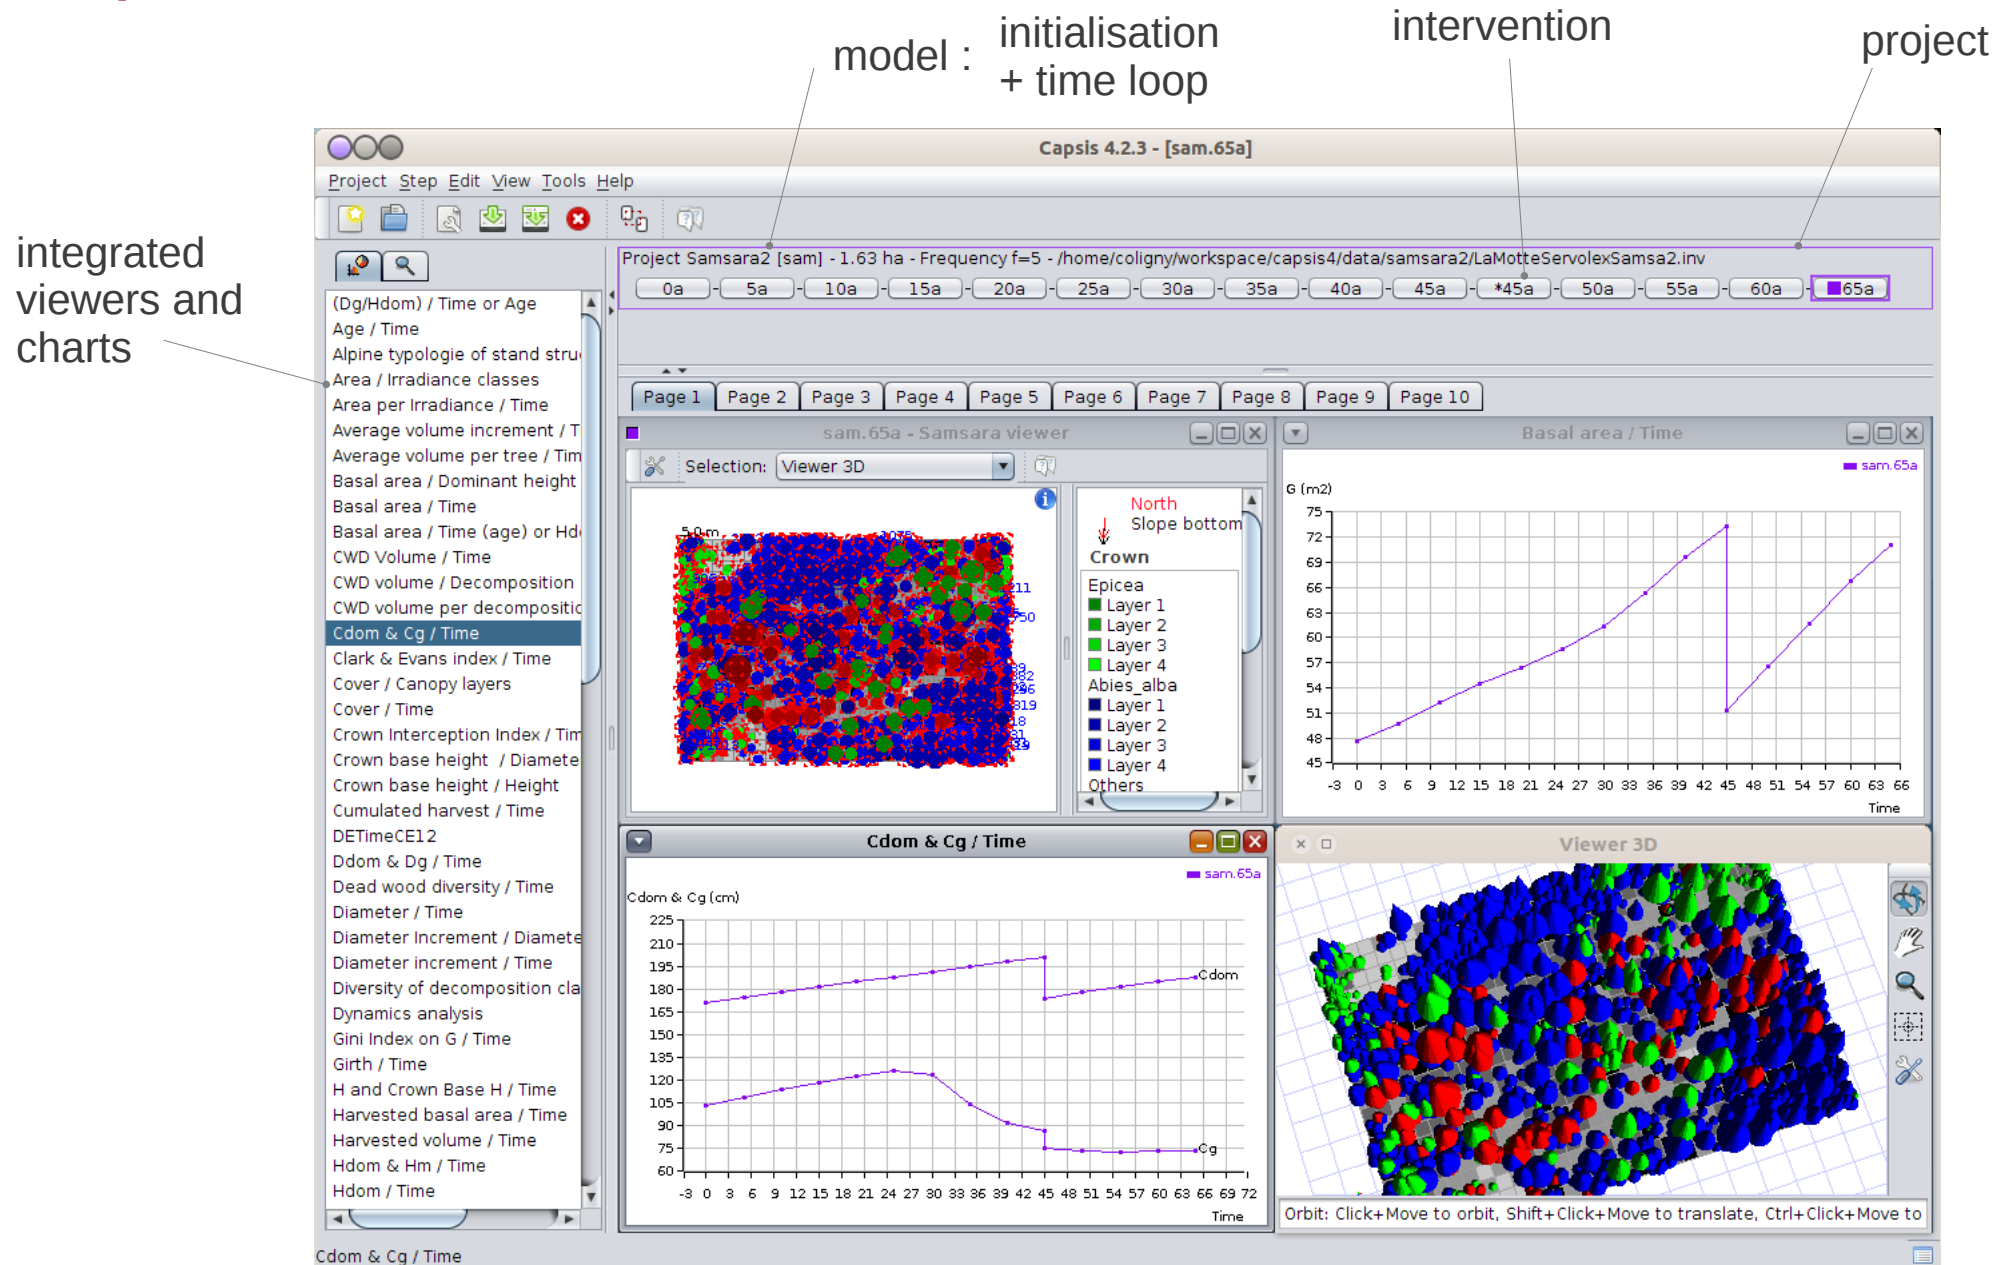

# Capsis - Computer-Aided Projection of Strategies In Silviculture

Objectives: Build a **software platform** to integrate **forest growth & yield / dynamics models** for **modellers, managers and teaching**

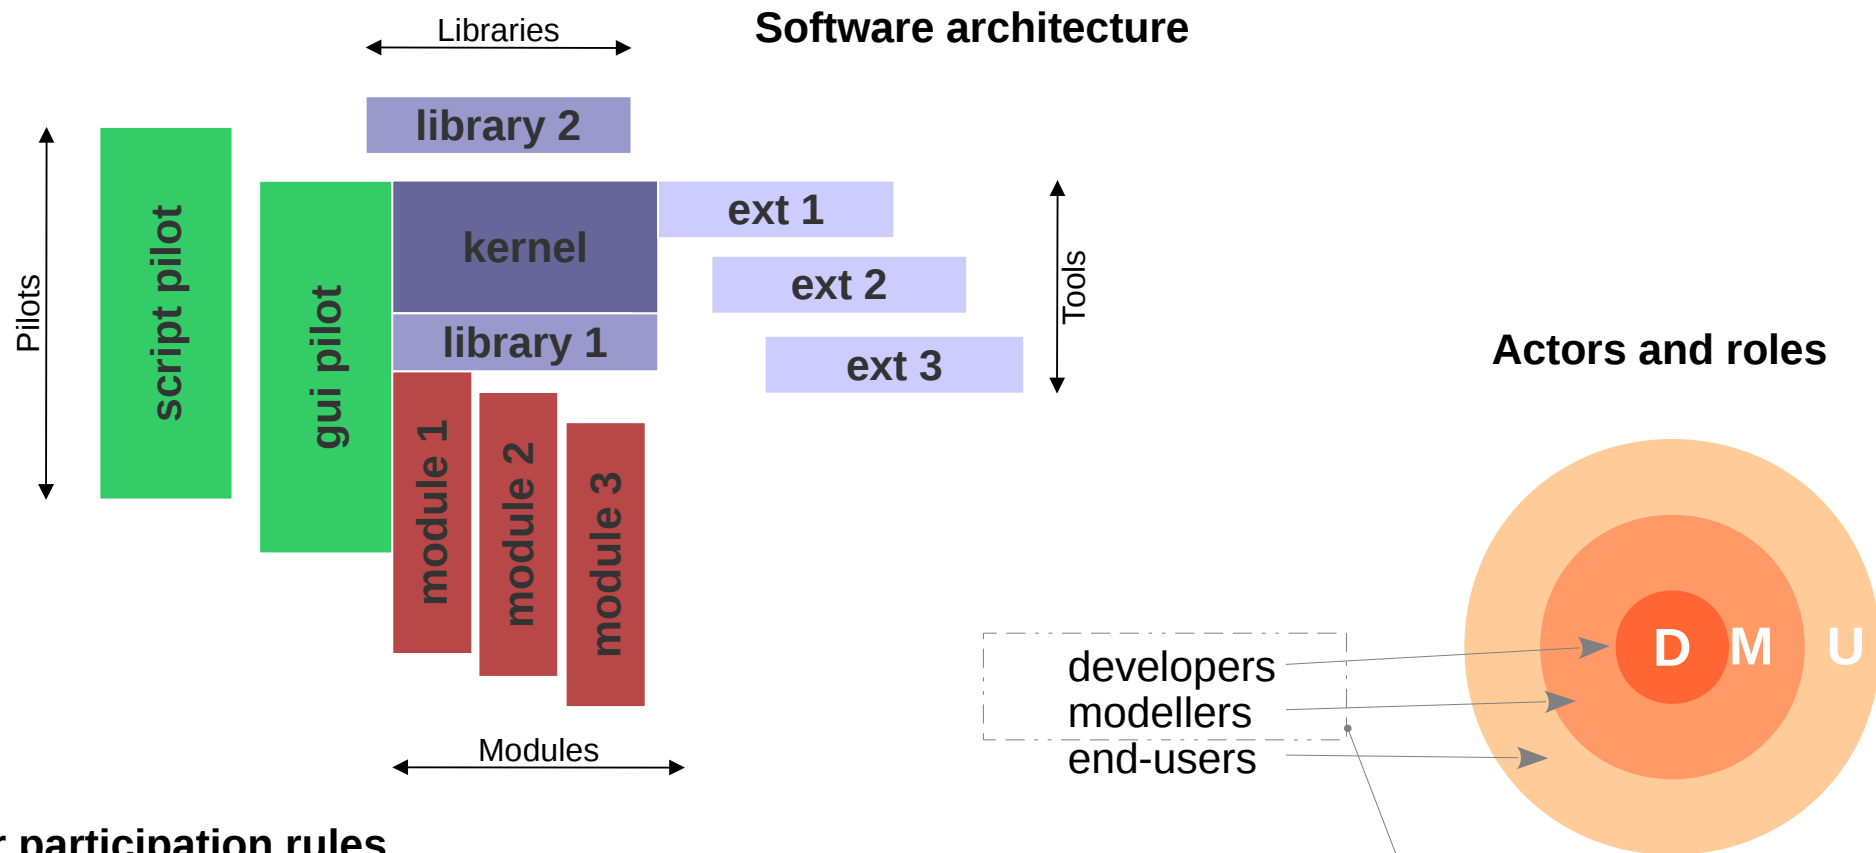

# Capsis: how does it work ?

Capsis - Linux - Graphical user interface - English

Capsis / AMAPstudio - MeMoWood Conference - Oct 1-4 2013 - Nancy

# Capsis : main options

## Clear participation rules

The common parts are free software (LGPL): everything except the **red parts** is reusable by anybody

The Capsis charter (extract):

- the modellers are in charge of the development of their models
- the growth models are not free: **red parts**
- all the source codes are freely accessible by all members in the Capsis community...

# Methodology: help the modellers develop by themselves

- an accessible language

Java is powerful and strict → accessible to scientists

- a short training course (1-2 days)

scientists become beginner developers

- a customized starting session (2-3 days)

start developing together  
work on the scientist's machine

- a permanent and effective support

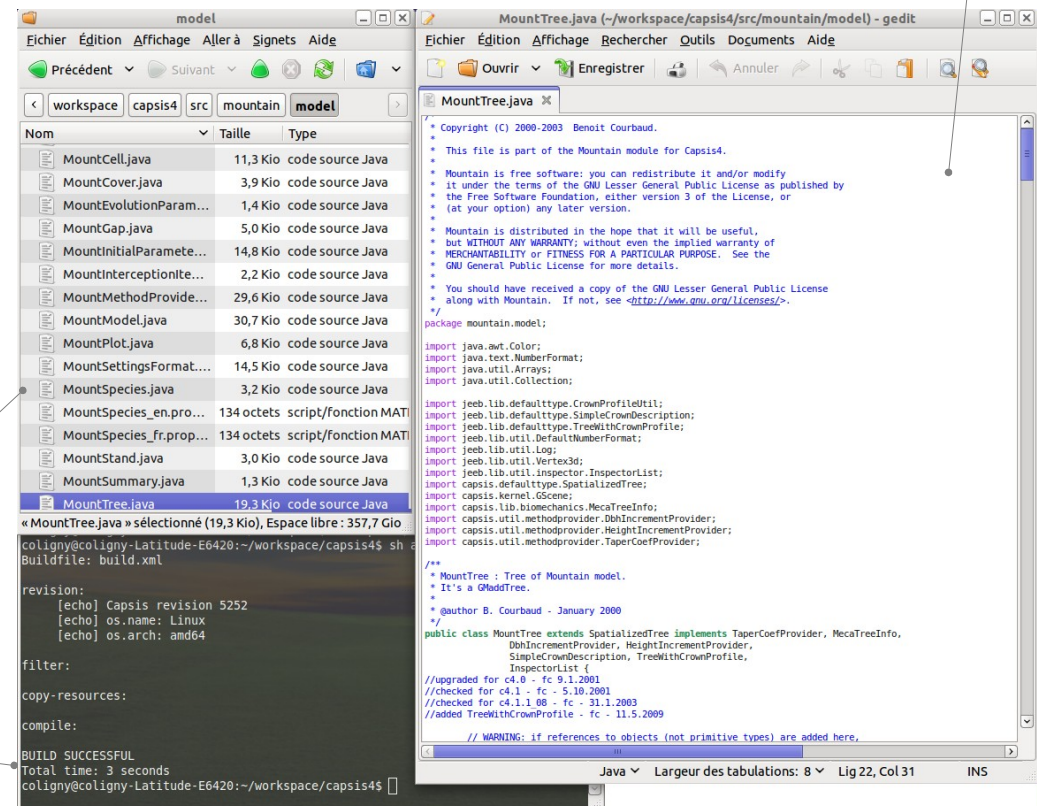

reactivity, availability

Simple tools...

a simple editor

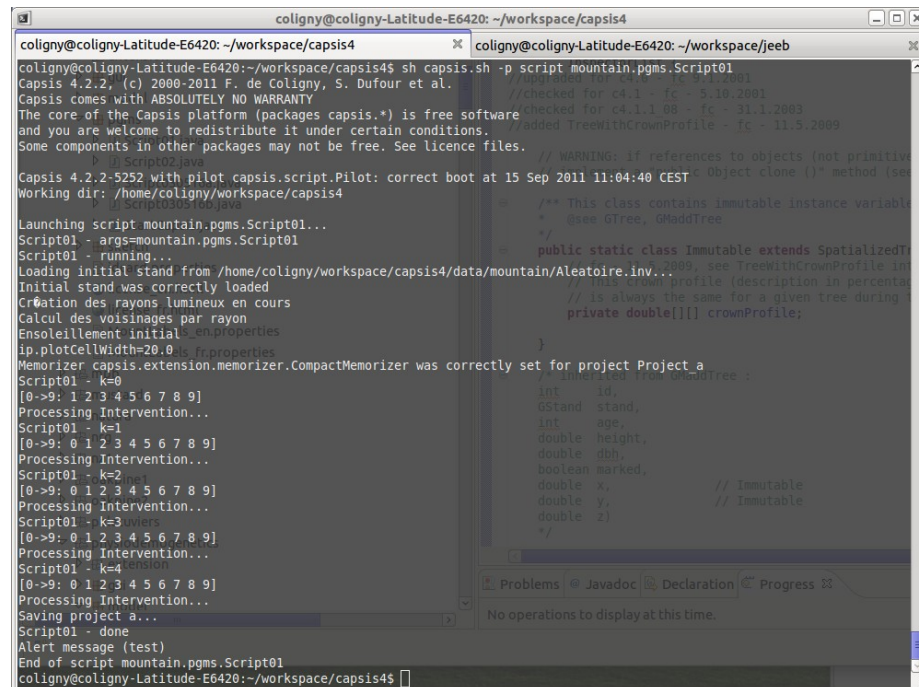

a file manager

a terminal

# Capsis: several ways of use

Interactive (french / english)

```

## Fagacées: an individual-based model for oak and beech

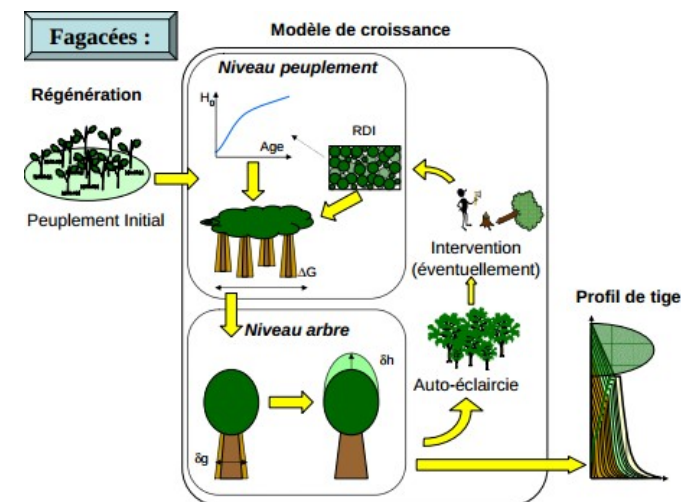

Fagacées relies on 5 fundamental relations at 2 levels

### 1. stand level

- a growth model for dominant height ( $H_0$ )
- a self thinning model giving the relative density index (RDI)
- a basal area (G) productivity model (Eichhorn)

### 2. tree level

- a model for distributing the increases at the tree scale
- a height / diameter model

Work under progress on the model to help revise the ONF *Chênaie Atlantique* silvicultural guide (Pascal Jarret, 2004)

Changing context, climatic change, productivity change...

Le Moguédec G., Dhôte J.-F., 2012. Fagacées: a tree-centered growth and yield model for sessile oak (*Quercus petraea* L.) and common beech (*Fagus sylvatica* L.). *Annals of Forest Science* (2012) 69:257–269.

## Oakpine: oak and pine growing at the same time

Quantify the impact of the spatial structure type on the productivity of oak-pine forests

Method:

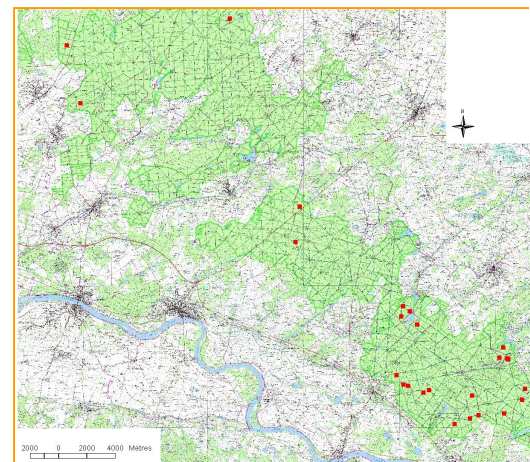

- simulate several types of realistic spatial structure (same list of trees)
- simulate growth for each structure type
- compare the obtained productivities

Spatial structure analysis on 34 plots:

typology: 4 types for the canopy / 3 types for the understorey

Spatial structures simulation: a combination of point processes

- specific structure: aggregation, random, regularity
- intertype structure: attraction, independence, repulsion

Simulation examples:

Canopée Type 1, modèle C7  
Ss étage Type 2, modèle SE6

Canopée Type 3, modèle C4  
Ss étage Type 2, modèle SE6

Script mode, repetitions, example of results:

Ngo Bieng M.-A., Perot T., de Coligny F., Goreaud F., 2013. Spatial pattern of trees influences species productivity in a mature oak-pine mixed forest. Eur J Forest Res, in press, DOI: 10.1007/s10342-013-0716-z

Capsis / AMAPstudio - MeMoWood Conference - Oct 1-4 2013 - Nancy

## PhysioDemoGenetics

PhysioDemoGenetics aims at studying the genetic adaptation through natural selection driven by climatic variables in a continuous tree population

-> accounts for complex interactions among genes, functional traits and climate when environment or demography are unstable.

It relies on (1) explicit modelling of the genetic determinism of ecophysiology-related traits and (2) the coupling of ecophysiological processes at tree level (Castanea library in Capsis) with dynamical processes (dispersal, growth, mortality) and genetic processes (Genetics library in Capsis)

### Results: population dynamics

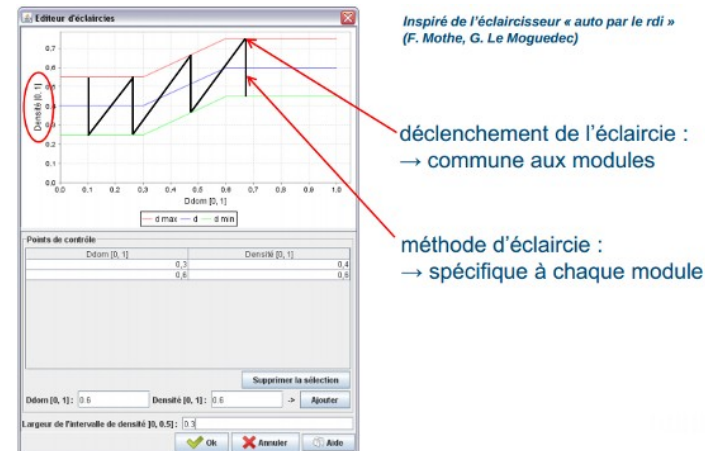

- Extinction of Alt5 at G0 and recolonisation at G3
- Treeline at 1620 m (versus observed =1700 m)

## Simmem: modelling several forests

Simmem is a model simulating the management of several forests at the same time  
Each forest grows with a specific Capsis model according to its species and forest structure  
Connections to Fasy, Fagacées, FTChene, Gymnos, Lemoine, Melies, Laricio and Sylvestris

The management rules are configured for the whole site

It is developed in the frame of the ANR Forgeco project by three teams:

- Irstea, Nogent sur Vernisson (P. Vallet, T. Cordonnier)
  - > Foret d'Orleans
  - > Massif du Vercors
- ULG, Gembloux, Belgium (P. Lejeune, G. Ligoit)
  - > Ardennes belges
- EFI Atlantic, Bordeaux (C. Orazio)
  - > Aquitaine

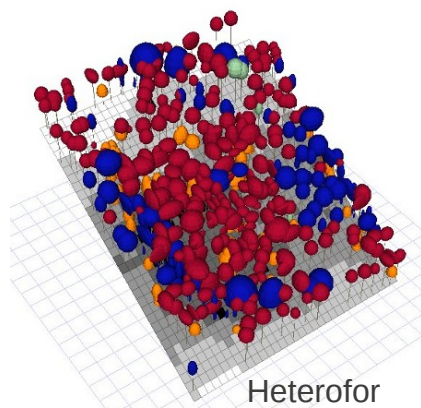

## SamsaraLight: a reusable library for radiative balance

A library implementing the radiative balance of the Samsara model, to make it possible to reuse it in other models (Quergus, Heteroform, RReShar, Samsara and Samsara2, Mountain).

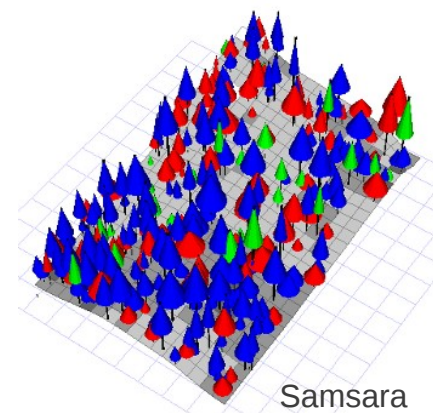

- adaptable to spatialized individual based models
- the crown is a kind of ellipsoid or a cone
- two modes: turbid medium volume or porous envelop
- irradiance (MJ) for each tree and each cell on the ground
- the irradiance can be considered for tree growth

Quergus  
(G. Ligot, ULG, Belgium)

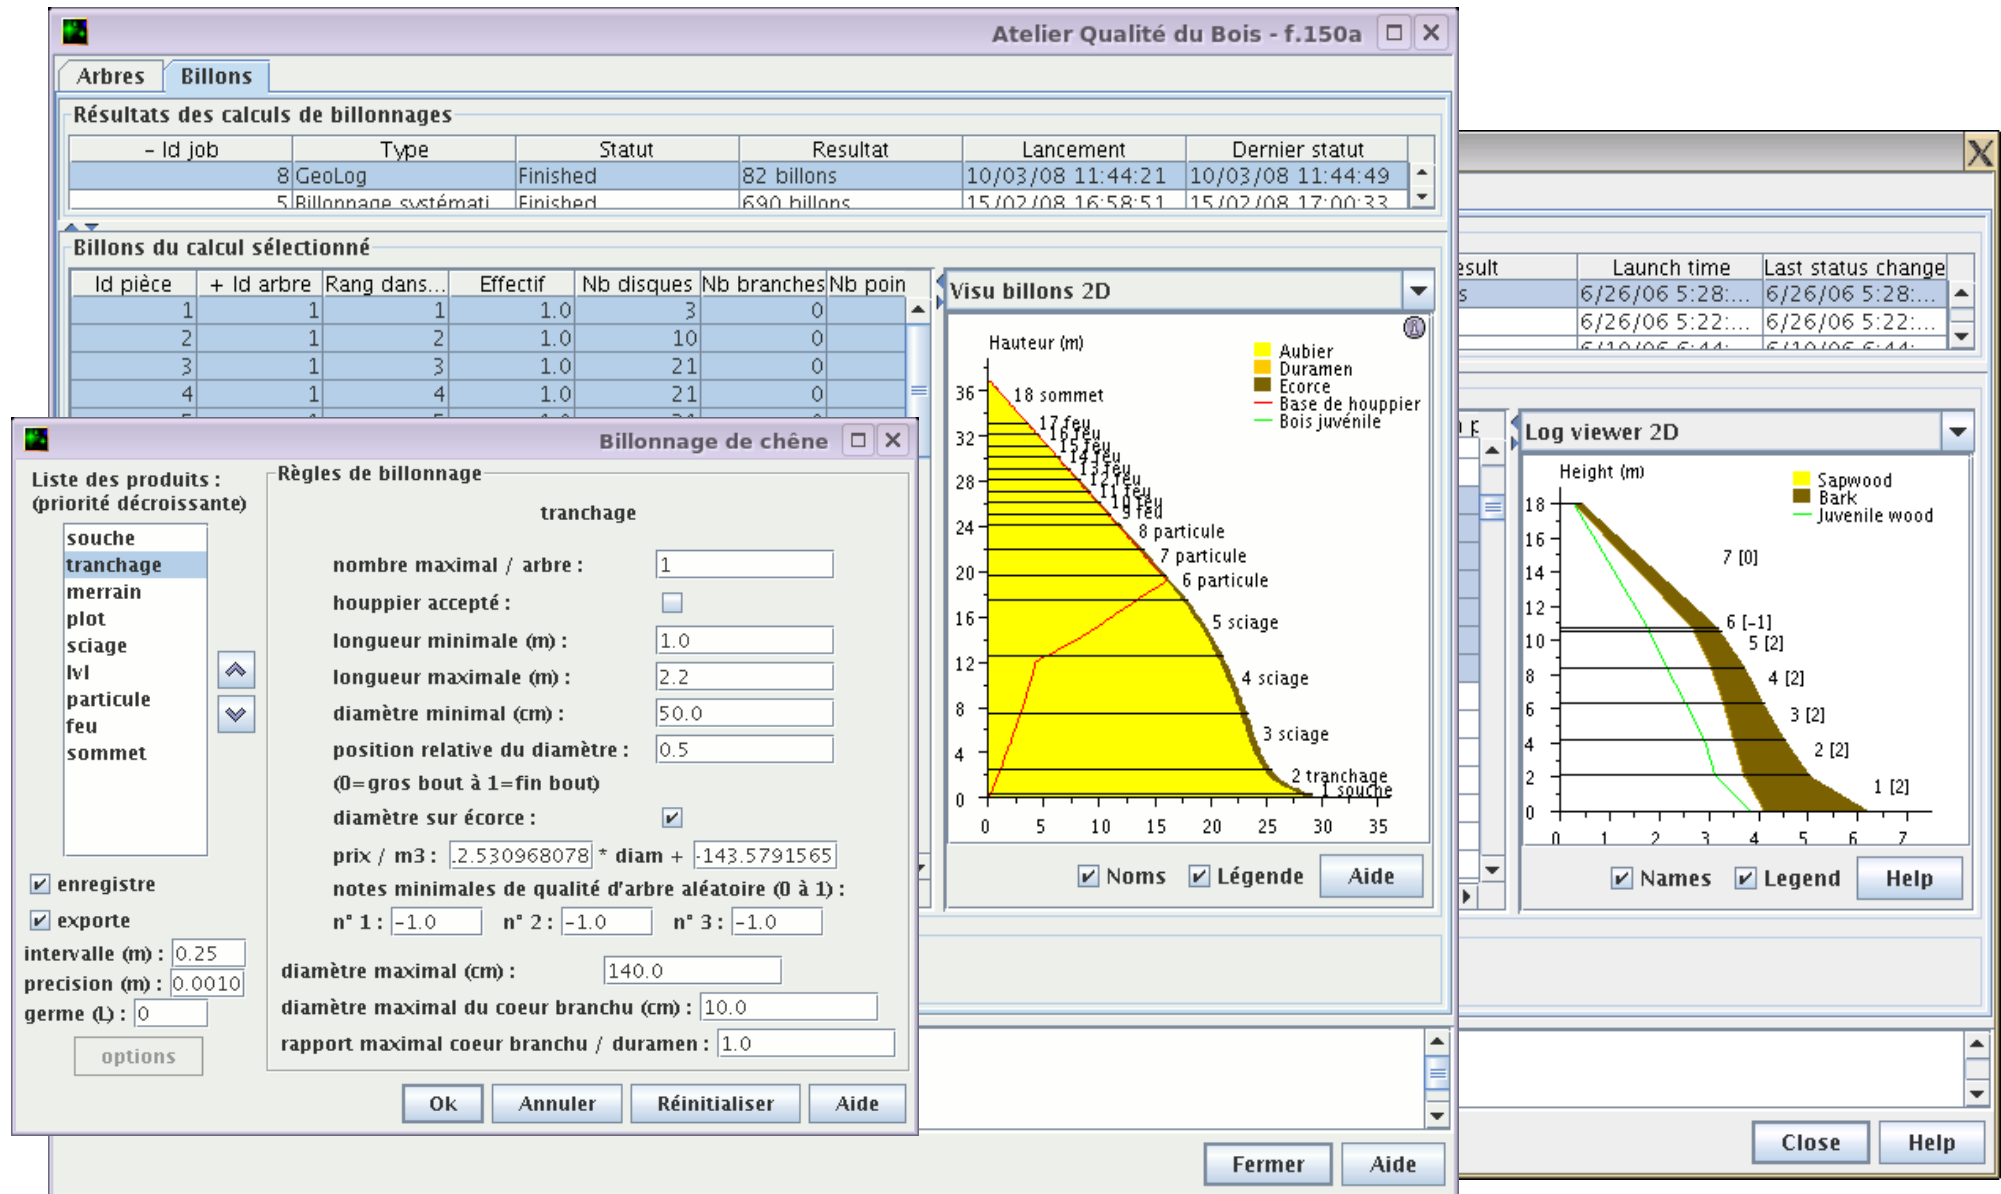

Heteroform  
(M. Jonard, UCL, Belgium)

Samsara  
(B. Courbaud, IRSTEA)

## Wood Quality Workshop

Coupled to a growth model (Radiata pine, Maritime pine, Oak), logging algorithms, sawing is possible

## Capsis-ONF-2012 - 21 dec 2012

- a Capsis installer on an ONF server for internal distribution
- upgraded each year (december) by ONF
- with the Capsis developers and modellers
- a single Capsis with 18 modules:

**Abial** (INRA)

**Artemis** (MRNF, Québec)

**CA1** (INRA)

**Fagacées** (INRA)

**Gymnos** (Gembloux, Belgique)

**Laricio** (Irstea, INRA)

**Lemoine** (INRA)

**Melies** (Irstea)

**NRG** (INRA)

**Oakpine1 et 2** (Irstea)

**PiceaAbies** (FCBA)

**PNN2** (INRA)

**Pp3** (INRA)

**Pseudotsugamenziesii** (FCBA)

**Regix** (FCBA)

**Samsara** (Irstea)

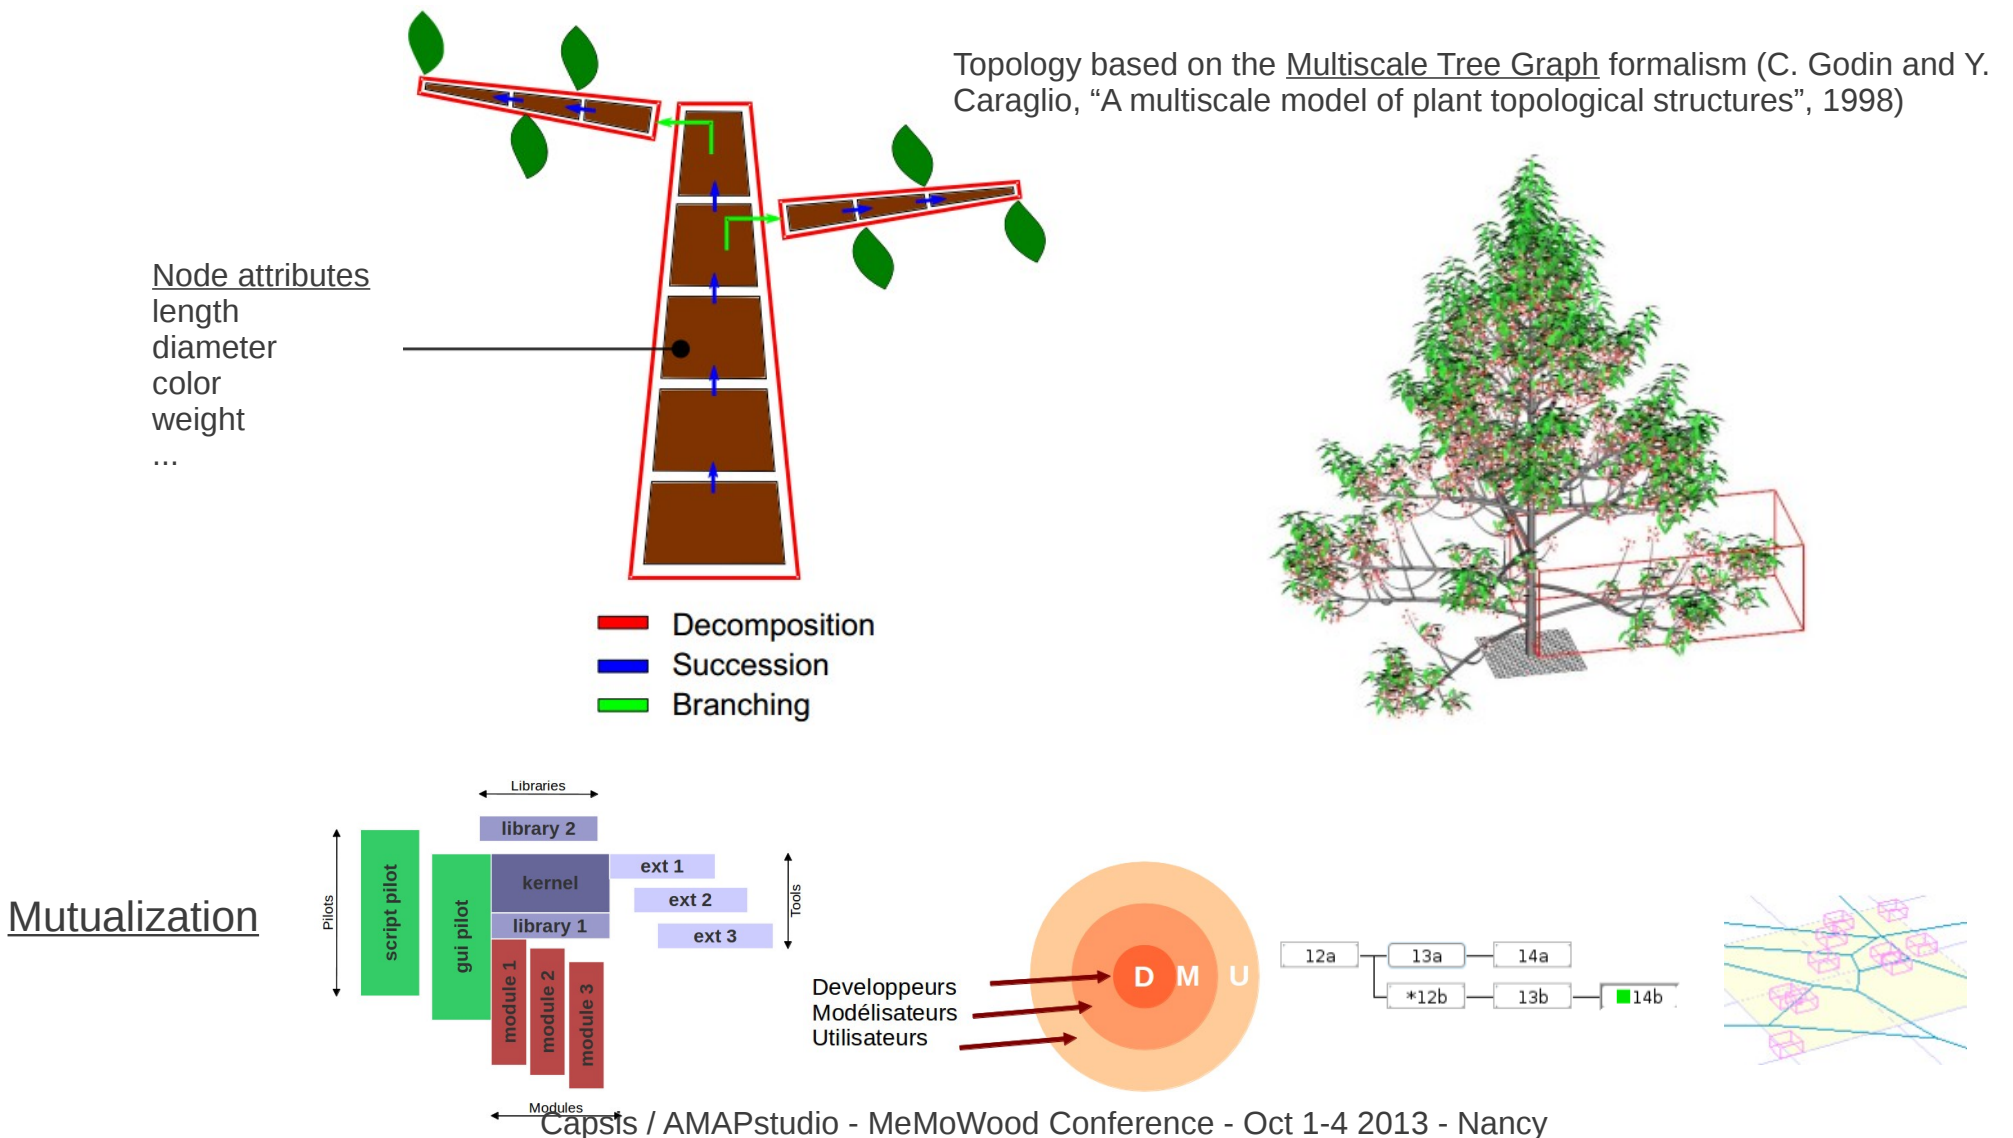

**Sylvestris** (Irstea)

Capsis helps write/update ONF silvicultural guides (about 17 since 2004)  
e.g. *Massif Vosgien - Sapin, épicéa et pin sylvestre*, Thierry Sardin (2012)

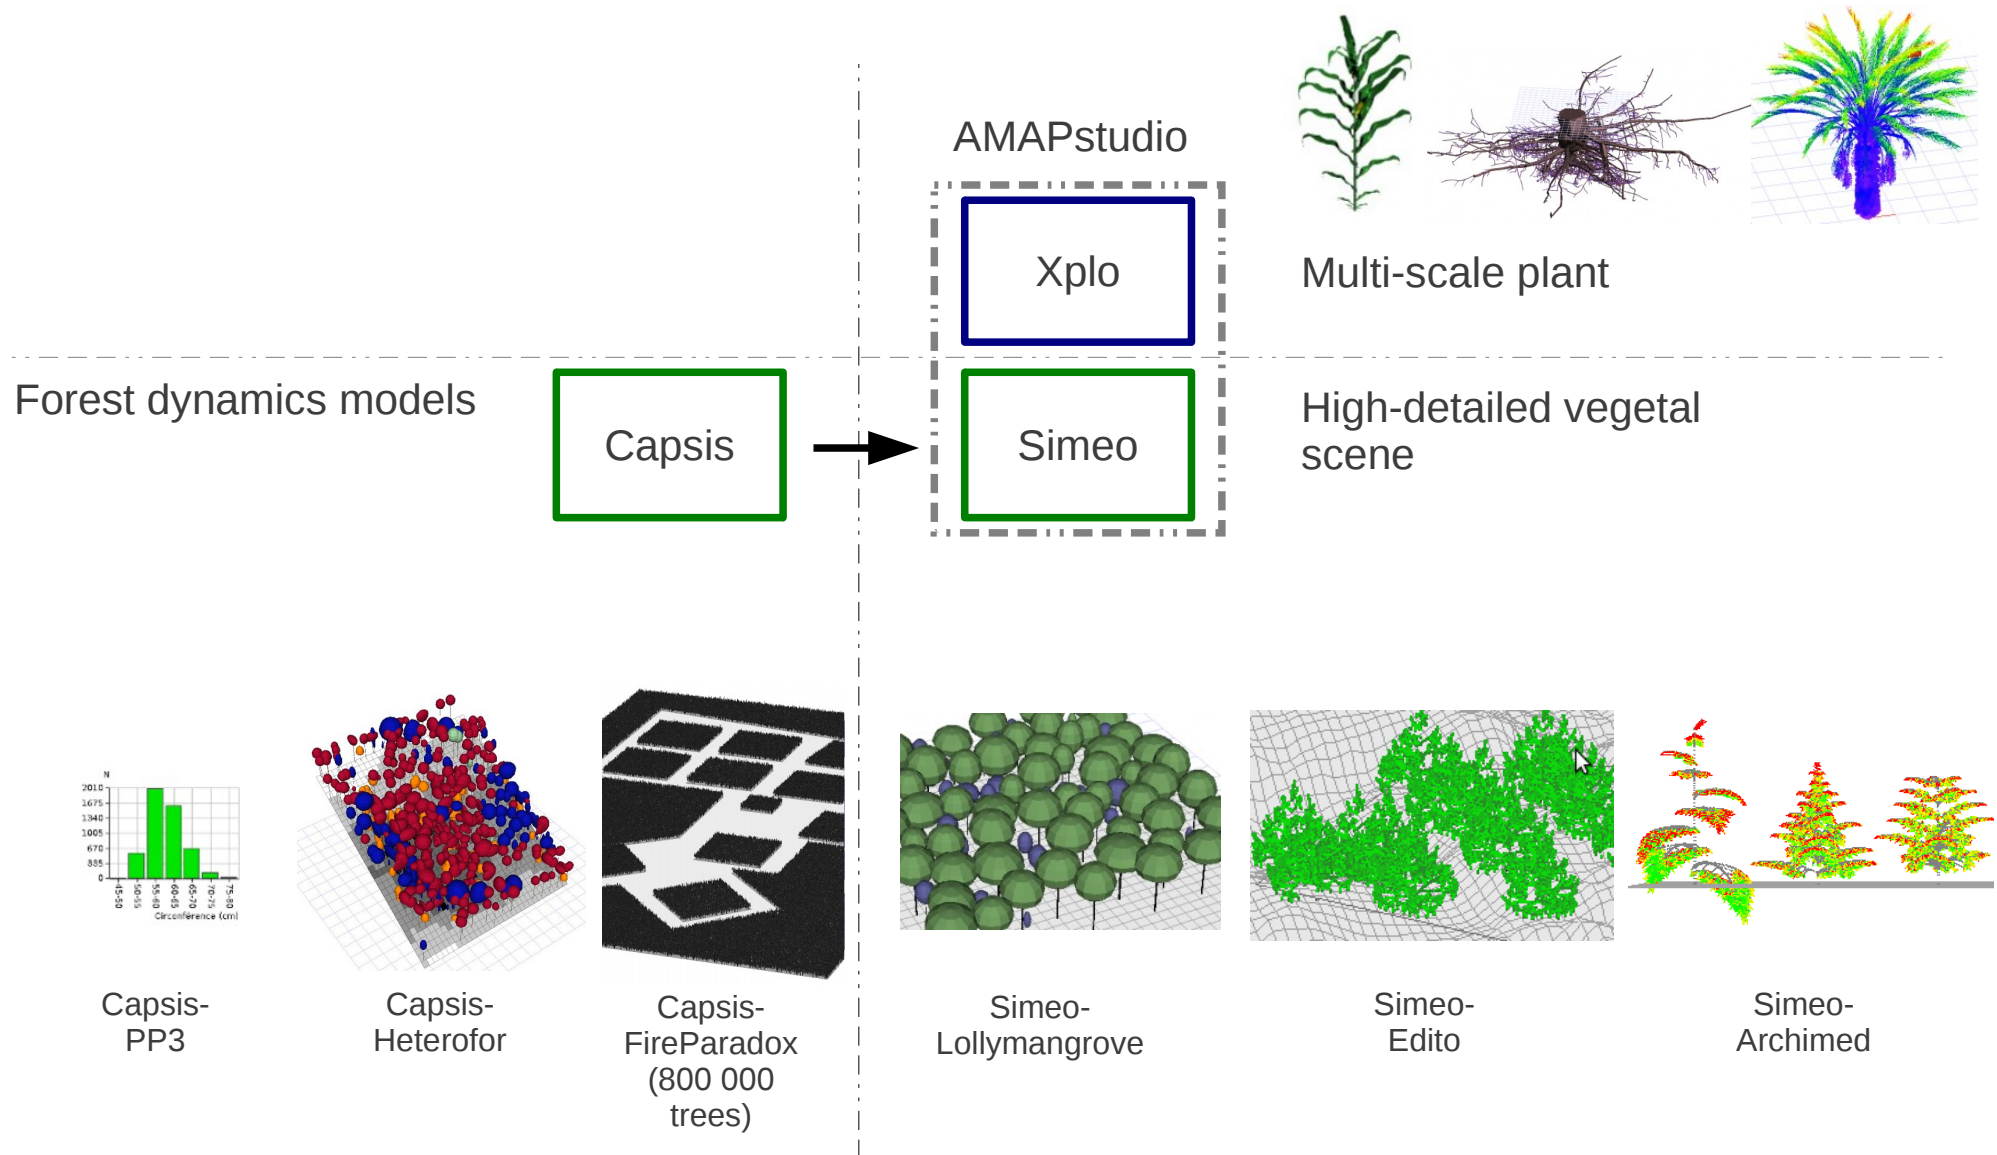

# AMAPstudio: a software suite for plants architecture modelling

Objectives: Build a **software suite** to provide **editors** and **integrate simulators** for plants multi-scale architecture modelling, for the individual plant or the vegetal scene, for **modellers and teaching**

# AMAPstudio: Xplo + Simeo

## Xplo: how does it work ?

selection

3D View

export

Excel like editor

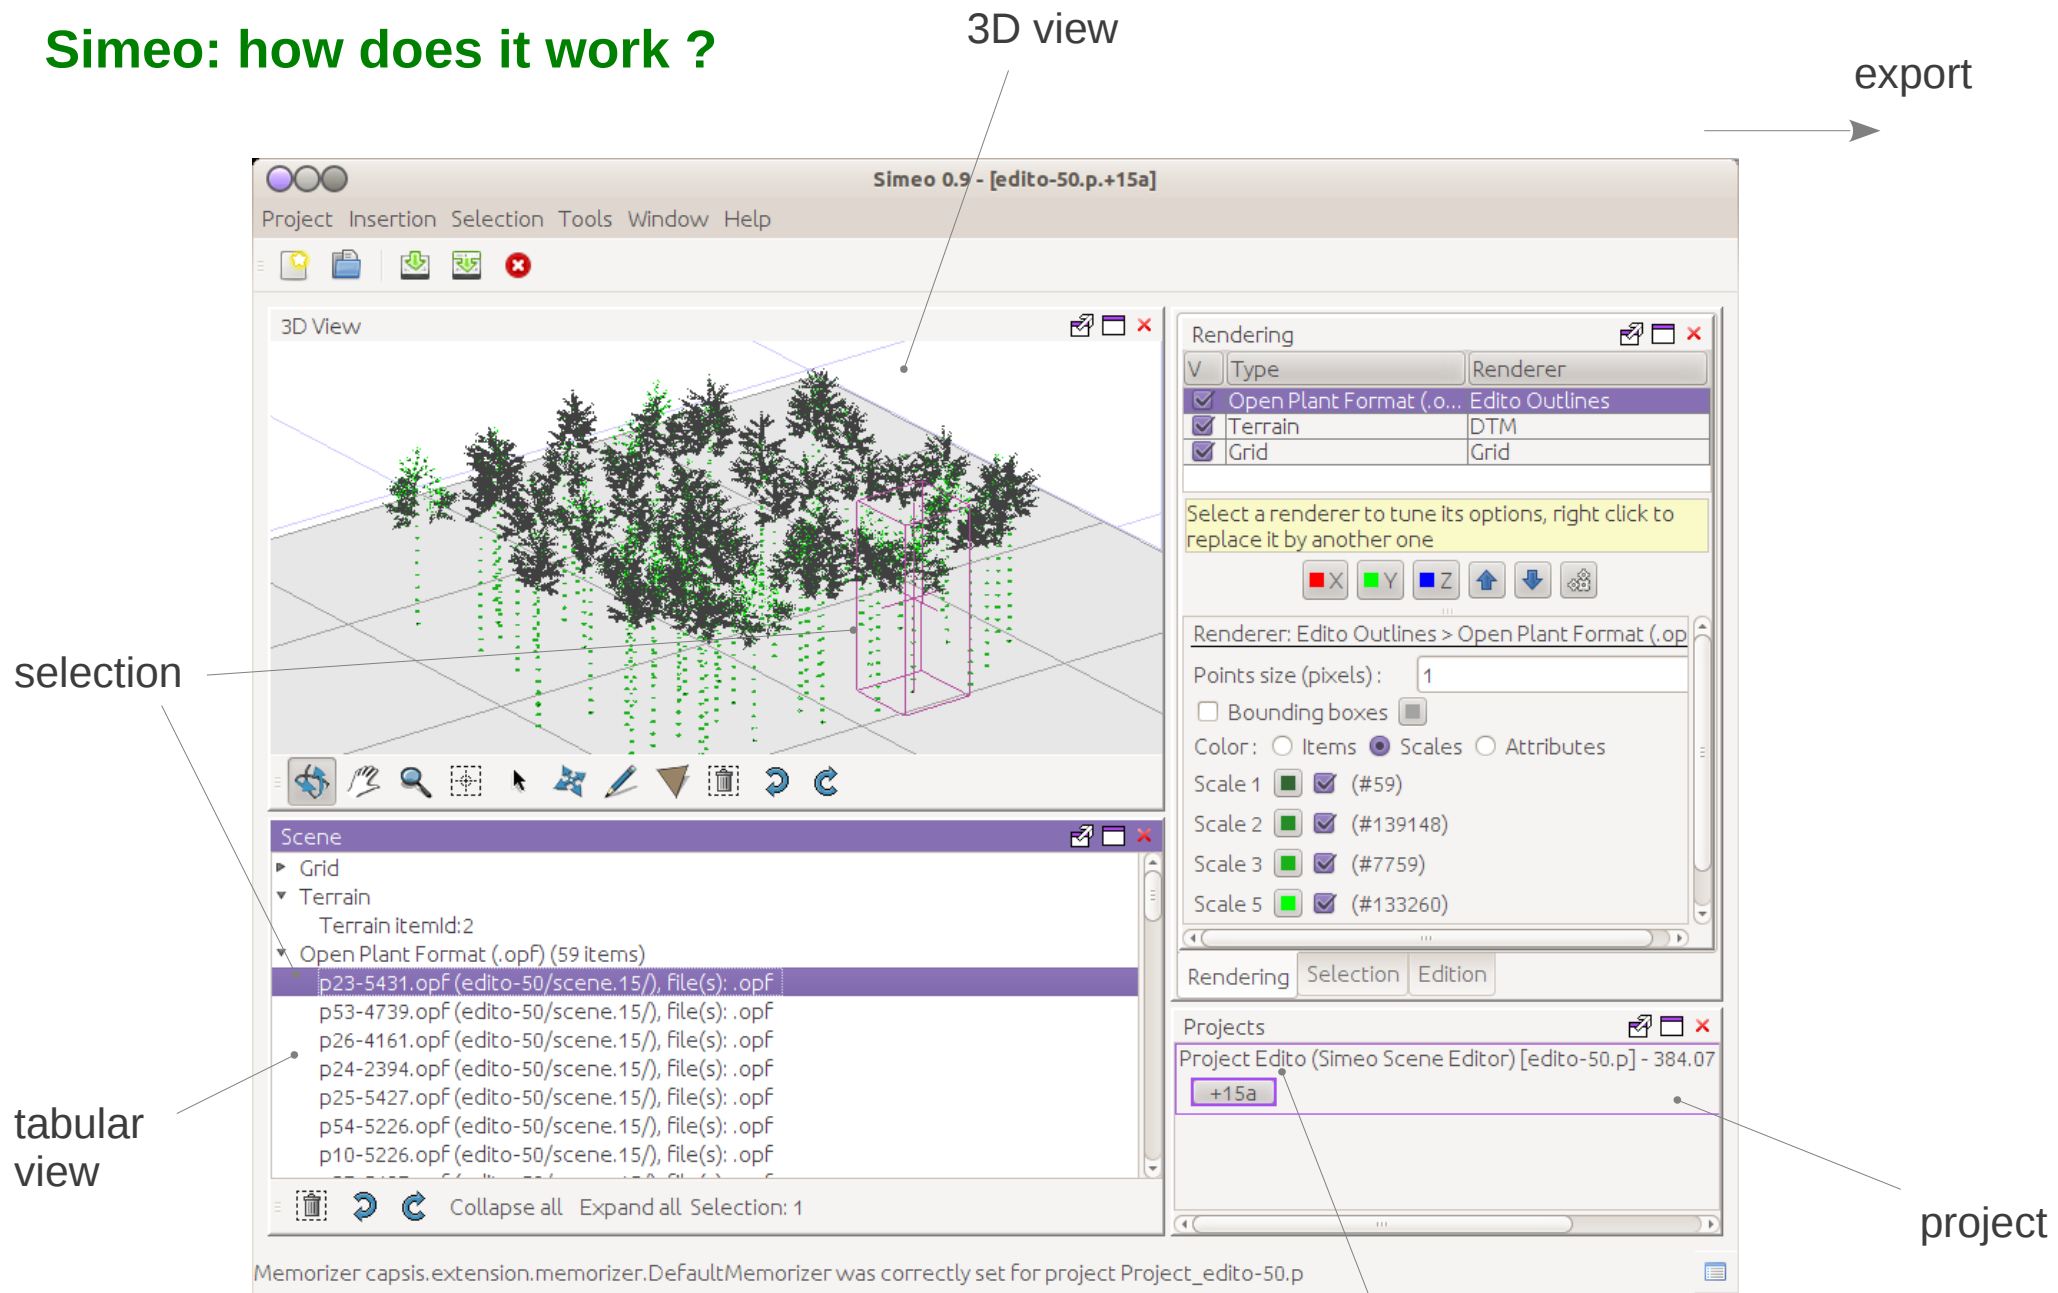

The screenshot displays the Xplo software interface. On the left, a hierarchical tree structure lists plant components such as Scene, PlantCorner, MainAxis, Metamer, Internode, Leaf, Petiole, and Blade, each with associated numerical data. A red box highlights a specific component in the tree. On the right, a 3D View window shows a rendered plant model with a red box highlighting a specific part. Below the 3D View, a Projects window shows a list of projects, with '100a' selected. An arrow points from the 'export' label to the top right of the interface.

project

model : initialisation  
+ time loop (optional)

Xplo - Linux - Graphical user interface - English

# Simeo: how does it work ?

Simeo - Linux - Graphical user interface - English

model : initialisation  
+ time loop (optional)

# Xplo / Simeo: Software design

## Xplo and Simeo editors

- create plants / vegetal scenes interactively
- check and correct them, build geometry
- run biophysical simulations (e.g. biomechanics)
- load and save plant / vegetal scenes
- export to other formats

An example: Retrospective analysis of fir sapling growth vs. light interception (Taugourdeau et al. 2010)

From plot to simulation, (a) view of a subplot in the dry (D) treatment, (b) plant architecture coded in accordance with AMAPMOD/MTG syntax (Godin & Caraglio, 1998), (c) topological and geometrical plant reconstruction with Xplo, (d) stand reconstruction with Simeo, (e) light interception calculated using MMR model and analyses by Xplo

Taugourdeau O., Dauzat J., Griffon S., de Coligny F., Sabatier S., Caraglio Y. & Barthélémy D., 2010. Retrospective analysis of fir sapling growth vs. light interception, Actes du 6ème colloque international sur la modélisation structure-fonction (Functional-Structural Plant Models, FSPM), 12-17/09/2010, Université de Californie à Davis (USA), pages (93-95)

## Greenlab 1

- *Greenlab* is a mathematical plant model simulating interactions between plant structure and functions
- biomass produced by organs (sources) is allocated to expanding organs (sinks) according to their relative demand
- plant parameters can be adjusted by fitting on real measurements
- *Greenlab* can compute the plant architecture for various species in interaction with their environment
- this model's underlying concepts can potentially predict the plant's phenotypic plasticity, for instance, pruning affects the internal competition for the resources and may lead to different leaf sizes

de Reffye P, Hu B-G. Relevant qualitative and quantitative choices for building an efficient dynamic plant growth model: GreenLab case. In: Hu B, Jaeger M, eds. Plant Growth Modeling and Applications (PMA03); Proceedings of the 2003 International Symposium on Plant Growth Modeling, Simulation, Visualization and Their Applications; Tsinghua University Press, Springer; 2003. p. 87-107

## Principes

- models and simules the development and architecture of vegetative and reproductive parts of date palm (*Phoenix dactylifera* L.) from germination to any age
- a continuation of studies that have been carried out for almost 20 years on palm-tree architecture
- Principes brings a generic, multi-scale, structural model for palm-trees based on the organisation of the various organs
- each organ carries its own attributes (lengths, diameters, branching or deviation angles, inter organs distances, etc.)

## InSilEco - Architectural plasticity in ecological communities

- simulate the growth of several tree individuals in a forest stand
- the growth of an axis depends on the amount of light that it and its leaves receive
- the simulation process then combines architectural rules defined at species level (AmapSim), an illumination module used to assess light interception by leaves (MIR), and a coupling of axis growth and ramification capabilities with local light interception

The objective is to assess the effect of competition for light within and between species on the overall structure of the forest stand

Powered by AmapSim, Simeo and Archimed-MMR

## Exporting to other formats / software

.ops / .opf / .mtg

```
# Simeo OpsFormatExport: Mon Oct 15 11:46:11 CEST 2012

# Part 1: one line per plant in the scene
#sceneId      plantId plantFileName  x      y      z      scal
1            1      opf/p1-mod_Rauh_14.opf  30.862822679993986  50.0
1            3      opf/p3-mod_Scarrone_7.opf  54.86255259261524
1            4      opf/p4-mod_Massart_10.opf  45.36609940359506

## Perspectives

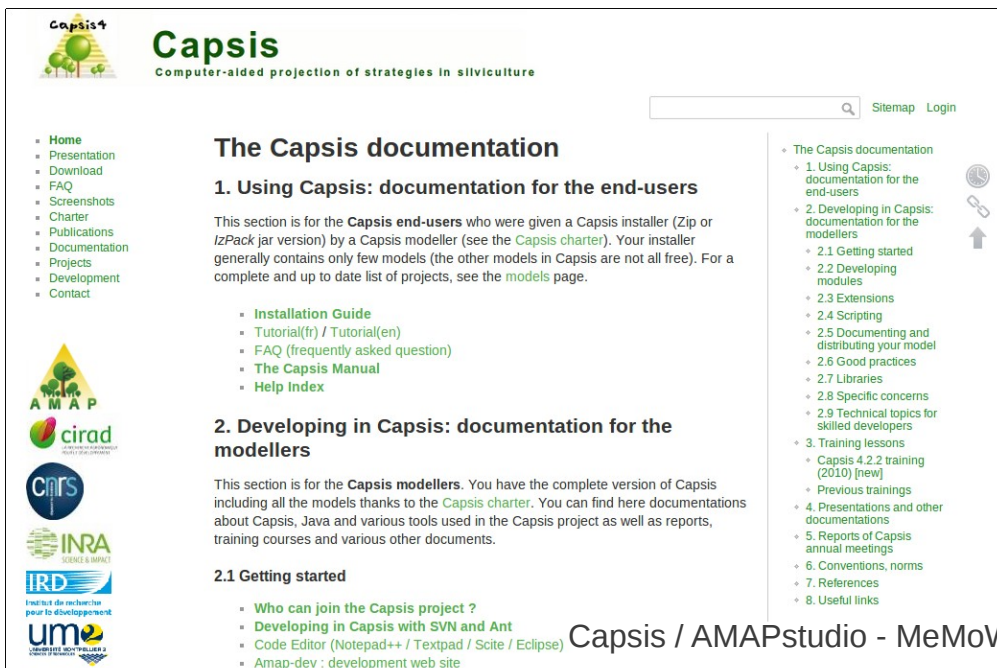

Capsis is in production: 60 models integrated since 1999

- support new projects starting
- training courses, starting sessions
- permanent support
- annual meeting

AMAPstudio is younger

- improve our software
- support medium / big size projects like Capsis (ANR, European project...)
- find partners outside the lab
- support simulation models for high detailed vegetation scenes

<http://www.inra.fr/capsis>

The screenshot shows the Capsis website with a green header and a sidebar with navigation links. The main content area is titled 'The Capsis documentation' and contains two sections: '1. Using Capsis: documentation for the end-users' and '2. Developing in Capsis: documentation for the modellers'. The first section includes a paragraph about the Capsis end-users and a list of links: 'Installation Guide', 'Tutorial(fr) / Tutorial(en)', 'FAQ (frequently asked question)', 'The Capsis Manual', and 'Help Index'. The second section includes a paragraph about the Capsis modellers and a list of links: 'Who can join the Capsis project?', 'Developing in Capsis with SVN and Ant', 'Code Editor (Notepad++ / Textpad / Scite / Eclipse)', and 'Amap-dev : development web site'.

### The Capsis documentation

#### 1. Using Capsis: documentation for the end-users

This section is for the **Capsis end-users** who were given a Capsis installer (Zip or IzPack jar version) by a Capsis modeller (see the [Capsis charter](#)). Your installer generally contains only few models (the other models in Capsis are not all free). For a complete and up to date list of projects, see the [models](#) page.

- Installation Guide
- Tutorial(fr) / Tutorial(en)
- FAQ (frequently asked question)
- The Capsis Manual
- Help Index

#### 2. Developing in Capsis: documentation for the modellers

This section is for the **Capsis modellers**. You have the complete version of Capsis including all the models thanks to the [Capsis charter](#). You can find here documentations about Capsis, Java and various tools used in the Capsis project as well as reports, training courses and various other documents.

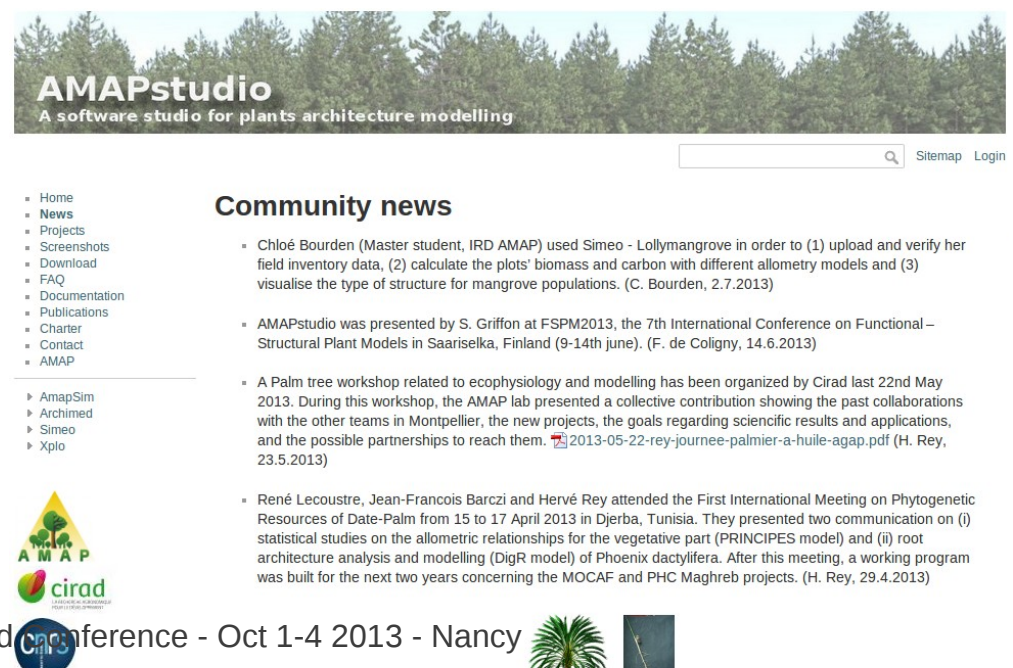

##### 2.1 Getting started

- Who can join the Capsis project ?
- Developing in Capsis with SVN and Ant
- Code Editor (Notepad++ / Textpad / Scite / Eclipse)
- Amap-dev : development web site

The Capsis documentation

- 1. Using Capsis: documentation for the end-users
- 2. Developing in Capsis: documentation for the modellers
  - 2.1 Getting started
  - 2.2 Developing modules
  - 2.3 Extensions
  - 2.4 Scripting
  - 2.5 Documenting and distributing your model
  - 2.6 Good practices
  - 2.7 Libraries
  - 2.8 Specific concerns
  - 2.9 Technical topics for skilled developers
- 3. Training lessons
  - Capsis 4.2.2 training (2010) [new]
  - Previous trainings
- 4. Presentations and other documentations
- 5. Reports of Capsis annual meetings
- 6. Conventions, norms
- 7. References
- 8. Useful links

<http://amapstudio.cirad.fr>

The screenshot shows the AMAPstudio website with a green header and a sidebar with navigation links. The main content area is titled 'Community news' and contains a list of news items. The first item is about Chloé Bourden (Master student, IRD AMAP) using Simeo - Lollymangrove in order to (1) upload and verify her field inventory data, (2) calculate the plots' biomass and carbon with different allometry models and (3) visualise the type of structure for mangrove populations. The second item is about AMAPstudio being presented by S. Griffon at FSPM2013, the 7th International Conference on Functional – Structural Plant Models in Saariselka, Finland (9-14th june). The third item is about a Palm tree workshop related to ecophysiology and modelling being organized by Cirad last 22nd May 2013. The fourth item is about René Lecoustre, Jean-Francois Barczi and Hervé Rey attending the First International Meeting on Phylogenetic Resources of Date-Palm from 15 to 17 April 2013 in Djerba, Tunisia.

### Community news

- Chloé Bourden (Master student, IRD AMAP) used Simeo - Lollymangrove in order to (1) upload and verify her field inventory data, (2) calculate the plots' biomass and carbon with different allometry models and (3) visualise the type of structure for mangrove populations. (C. Bourden, 2.7.2013)
- AMAPstudio was presented by S. Griffon at FSPM2013, the 7th International Conference on Functional – Structural Plant Models in Saariselka, Finland (9-14th june). (F. de Coligny, 14.6.2013)
- A Palm tree workshop related to ecophysiology and modelling has been organized by Cirad last 22nd May 2013. During this workshop, the AMAP lab presented a collective contribution showing the past collaborations with the other teams in Montpellier, the new projects, the goals regarding scientific results and applications, and the possible partnerships to reach them. [2013-05-22-rey-journee-palmier-a-huile-agap.pdf](#) (H. Rey, 23.5.2013)
- René Lecoustre, Jean-Francois Barczi and Hervé Rey attended the First International Meeting on Phylogenetic Resources of Date-Palm from 15 to 17 April 2013 in Djerba, Tunisia. They presented two communication on (i) statistical studies on the allometric relationships for the vegetative part (PRINCIPES model) and (ii) root architecture analysis and modelling (DigR model) of Phoenix dactylifera. After this meeting, a working program was built for the next two years concerning the MOCAF and PHC Maghreb projects. (H. Rey, 29.4.2013)

Dufour-Kowalski S., Courbaud B., Dreyfus P., Meredieu C., de Coligny F., 2012. Capsis: an open software framework and community for forest growth modelling. *Annals of Forest Science* (2012) 69:221–233

Griffon S., de Coligny F. 2012. AMAPstudio: a Software Suite for Plants Architecture Modelling. In: Kang M., Dumont Y., Guo Y., eds. *Plant Growth Modeling, Simulation, Visualization and Applications*. Proceedings of PMA12. Shanghai, China: IEEE press, pp. 141:147

## Models for maritime pine in the *Landes de Gascogne*

Lemoine model (stand level, plantation):

- age
- number of trees
- girth (dominant, mean)
- basal area
- height (dominant, mean)
- volume (mean)

PP3 model (distribution model, plantation):  
a list of trees

- age
- diameter, Height, volume of each tree
- number of trees in each category
- crown (Height, diameter)
- other information (biomass, carbon, etc.)

Applications, further works:

- a permanent resource analysis system (with IFN - National Forest Inventory)
- dead wood modelling and biodiversity
- models transfer to the silviculture prescribers

# Jackpine

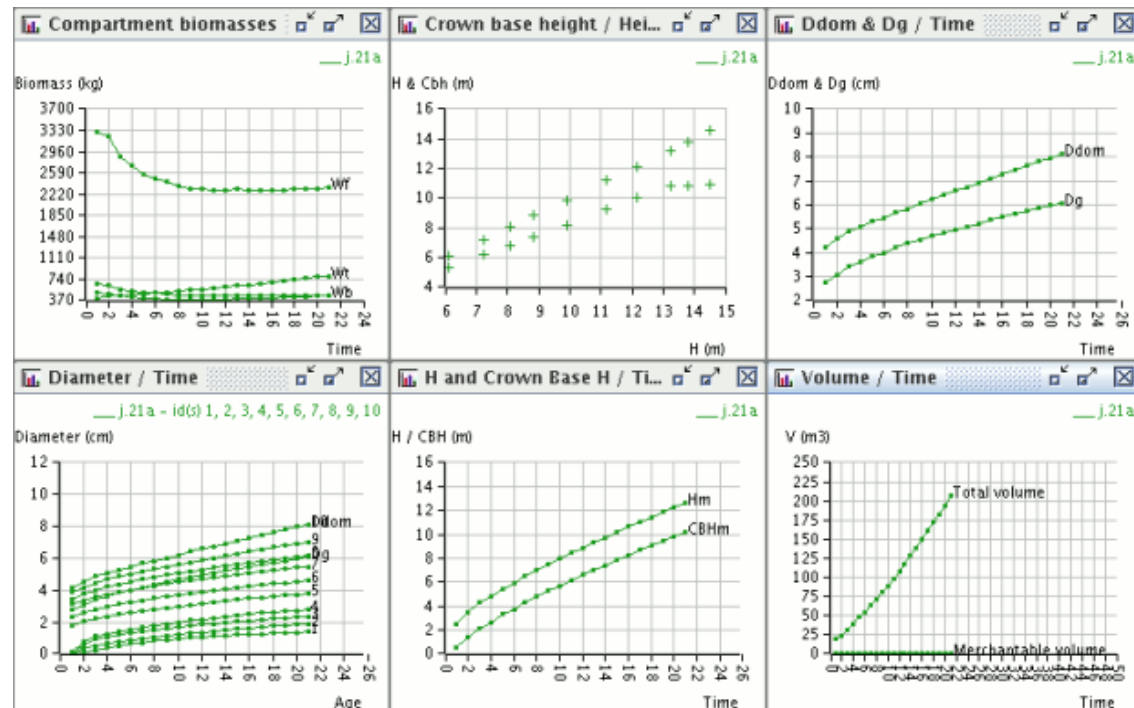

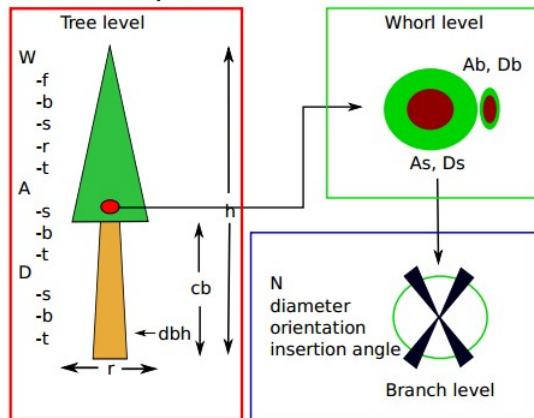

Predict the effect of different scenarios on the growth and wood quality of jack pine, black and white spruce in Québec.

The Crobas - PipeQual model by Annikki Makela (University of Helsinki, Finland), a reusable library for Crobas was added in Capsis

## Model inputs

## Model outputs

## Artemis-2009

A distance-independent tree model for the main potential vegetations in the province of Québec

Objectives, at the provincial level:

- develop silvicultural strategies
- update sample plots
- calculate the allowable cut

Six sub-models to forecast (i) the temporal change of mortality, (ii) diameter growth at breast height (dbh) of surviving stems, (iii) the number of recruits, (iv) their diameters, (v) height and (vi) volume using dbh.

The permanent plots of the MRNF-DIF in Québec:  
12001 plots, from 1970

Other Capsis models by the Québec MRNF since 2002:

**Présage** (Daniel Mailly, Sylvain Turbis): a model of production and evaluation of scenarios to help management of forests in Québec

**SaMARE** (Sadi Aid, Sylvain Turbis): a distance-independent tree model for sugar maple- dominated stands (sugar maple, yellow birch, American beech and other broadleaved species)

**Natura** (Sadi Aid, Isabelle Auger): a whole-stand model for the province of Québec

**Succès** (Mathieu Fortin, Luc Langevin): a succession model for the main forest types in Québec

## twoe: tropical forests

twoe (2e) is a software that can be used for modelling and simulating multispecies tropical forest dynamics from permanent plot data

Two packages:

- an R package to estimate the demographic parameters of tropical tree species from permanent forest plot data
- a Capsis module to simulate forest dynamics

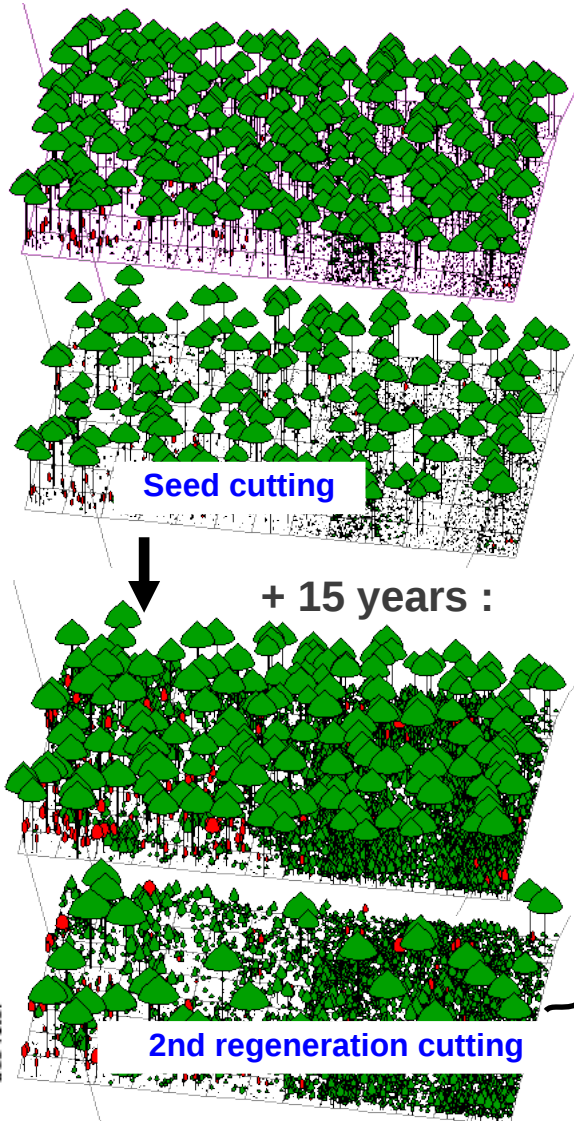

More details on <http://twoe.org/>

## Ventoux: modelling a forested massif

Realistic silvicultural scenario and evolution over 100 years

Initial stand:

+ 40 years :

+ 55 years :

+ 65 years :

+ 80 years :

+ 100 years :

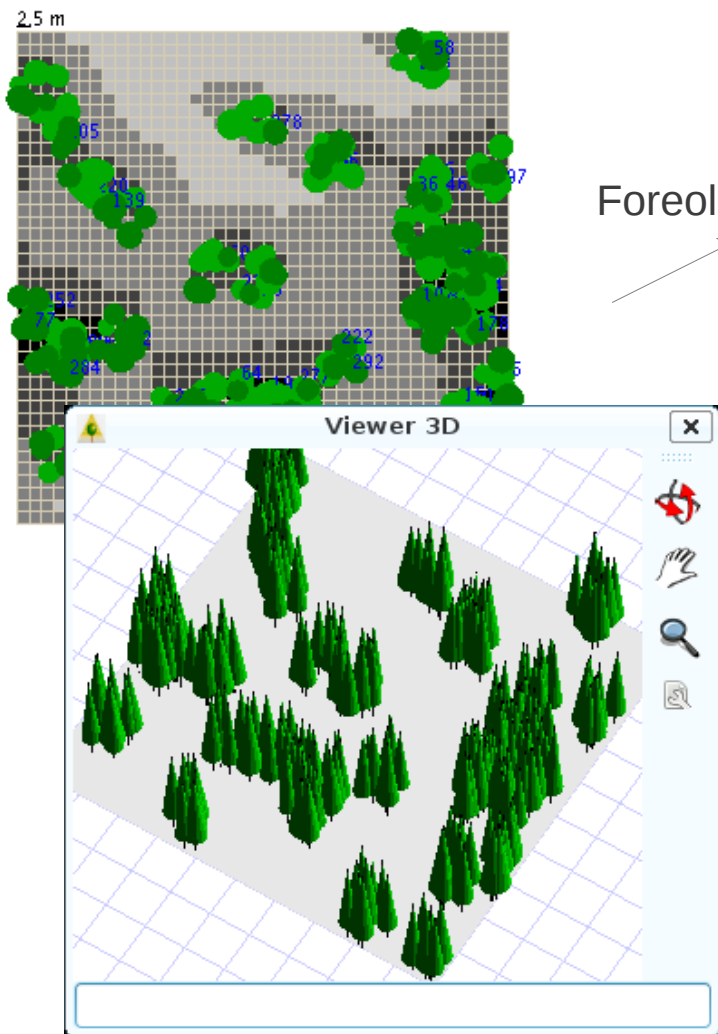

Figure 7 : Simulation d'un scénario sylvicole complet réaliste et évolution sur 100 ans d'une plantation de Pin noir (en vert) en cours de colonisation par le Hêtre (en rouge) : régénération par coupes progressives du couvert de Pin, qui bénéficie autant au Hêtre qu'aux semis de Pin ; dépassement unique, à l'occasion duquel la proportion des deux espèces peut être en partie modifiée (mais le dynamisme du Hêtre et sa faculté à rejeter ne permettent pas de l'éliminer, même si on souhaite favoriser au maximum le Pin) ; éclaircies, en nombre limité compte tenu de la nécessité d'offrir un volume suffisant à chaque intervention pour favoriser la vente des lots.

## Foreole: individual-based wind risk

An integrated library

- assess the risk
- simulate trees removal

Mountain growth model (Spruce)

Foreole

<sup>a</sup> "Pure" with a list of species means that the model either works with a pure stand of one of these species at a time or can simulate concurrently several pure stands of different species in the same forest

<sup>b</sup> Scale levels at which the model works or the module gives outputs (with more or less details depending on the model)

<sup>c</sup> Forest dynamics processes: growth (diameter and, possibly, height) (Gr), mortality (Mo), recruitment/regeneration (Re), dispersal (seeds/seedlings) (Di). Details for growth submodel: distance-independent tree growth (Gr (DI)), distance-dependent tree growth (Gr (DD)), growth submodel relying on a transition matrix or a diameter distribution curve (Gr (M/D))

<sup>d</sup> Genetics (Ge), ecophysiological processes (Phy), branching model (Br), automated thinning (in addition to Capsis' interactive intervention tools) (Th)

## Results 2/2

|               |                                | Irregular       | Tree, stand, forest            | Gr (DI), Re                 | Ge                             | <i>Vitellaria paradoxa</i>   | Karite              |
|               |                                |                 | Tree, stand                    | Gr (DD), Mo, Re             |                                | Many species   | Selva               |
|               |                                |                 | Tree, stand                    | Gr (DD), Mo, Re             | Br                             | Many species   | Stretch             |

<sup>a</sup> “Pure” with a list of species means that the model either works with a pure stand of one of these species at a time or can simulate concurrently several pure stands of different species in the same forest

<sup>b</sup> Scale levels at which the model works or the module gives outputs (with more or less details depending on the model)

<sup>c</sup> Forest dynamics processes: growth (diameter and, possibly, height) (Gr), mortality (Mo), recruitment/regeneration (Re), dispersal (seeds/seedlings) (Di). Details for growth submodel: distance-independent tree growth (Gr (DI)), distance-dependent tree growth (Gr (DD)), growth submodel relying on a transition matrix or a diameter distribution curve (Gr (M/D))

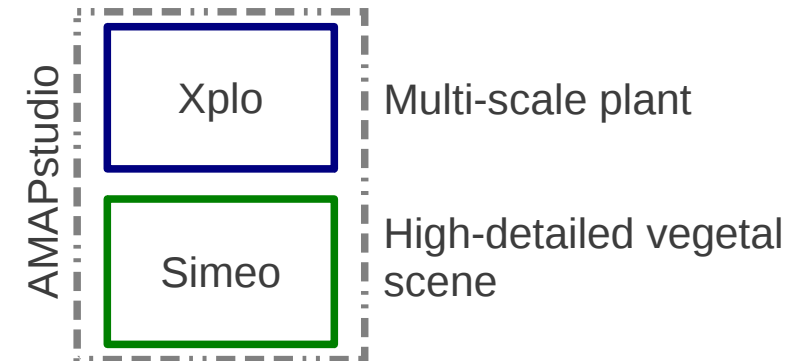

<sup>d</sup> Genetics (Ge), ecophysiological processes (Phy), branching model (Br), automated thinning (in addition to Capsis’ interactive intervention tools) (Th)

# AMAPstudio: a software suite for plants architecture modelling

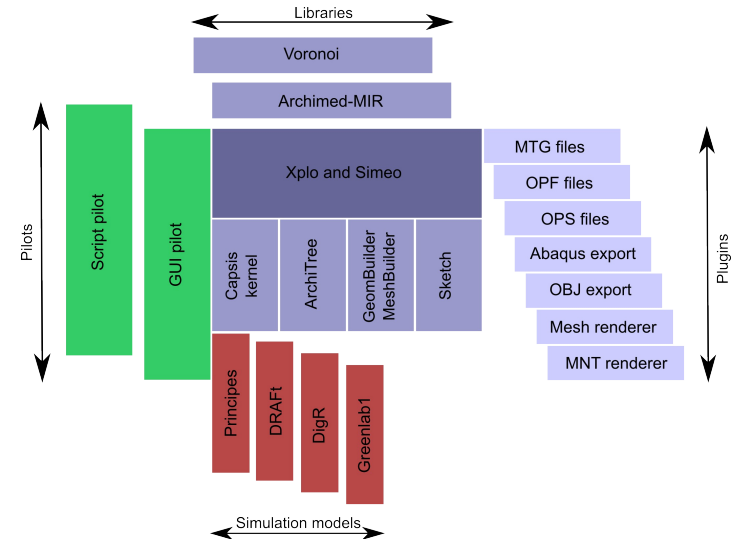

AMAPstudio contains applications and models

- to rebuild, explore, analyse and study the growth of plants from an architectural point of view
- at the individual or vegetal scene level

A palm-tree 3D mock-up under inspection in Xplo (Hervé Rey, Cirad AMAP)

# AMAPstudio: the Charter

## Clear participation rules

All the common parts are free software (LGPL), they are reusable by everyone  
-> all **except the workspace/, xplo/module/ and simeo/module/ directories**

- **Free kernel:** the AMAPstudio kernel is a free software (LGPL licence) : **kernels** + **generic pilots** + **extensions** + **libraries**
- **Development:** the modellers are in charge of the development of their models in AMAPstudio
- **Support:** They can have support from the developers : training sessions, design, starting help, further assistance
- **Free access in the community:** All the source codes are freely accessible by all members in the AMAPstudio community, modules may become the base for new modules, code can be shared...
- **Respect of intellectual property:** all members respect the intellectual property of the other members
- **Validations:** developers deal with technical validation, modellers deal with functional validation
- **Distribution:** the stabilized / validated modules may be distributed when the author decides and chooses a licence (LGPL free license suggested)
- **Decentralization:** modellers manage directly the relations with their end-users: financing, training, assistance, models documentation, contracts...

## DigR

- *DigR* (Rey et al., 2011) is a root architectural model and simulator
- it relies on topological concepts as apical growth, lateral branching, senescence and death, and geometrical features as secondary growth and axes spatial positioning
- each of these properties are sorted into a root typology
- the current version runs without functional processes, however AMAPstudio will help developing further versions including functional – structural interactions during growth simulation and dealing with environmental influence (i.e. soil properties or aerial part contribution)

## DRAft (Demand, Resource, Architecture and Functioning at discrete time)

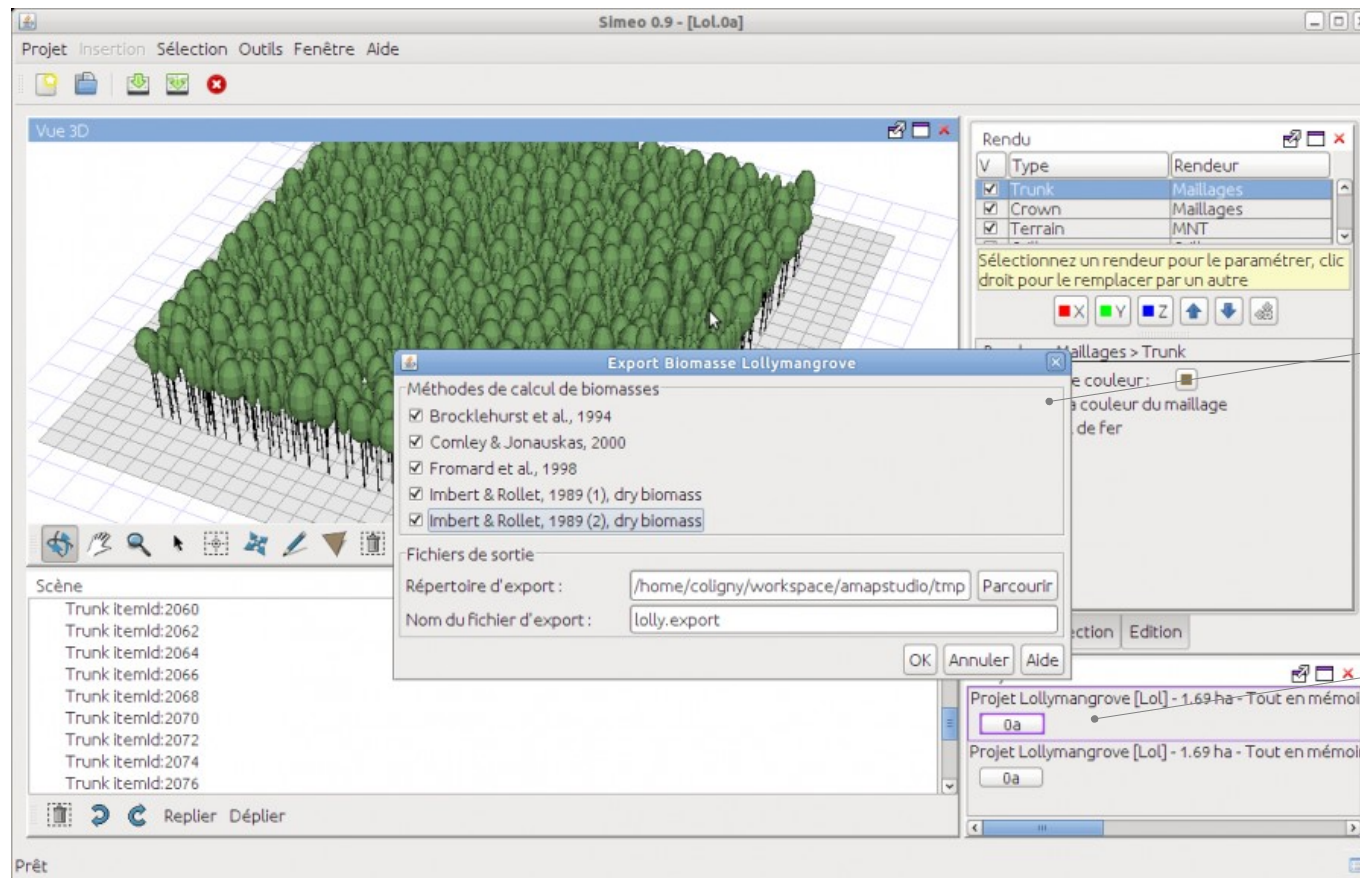

- a minimal FSPM designed to simulate emerging plants morphogenetical gradients
- tree architecture gradients is an emerging property of the interplay between structure function and iterative development
- DRAft simulates the development and functioning of the tree aerial part at a yearly step
- it is based on biomass allocation, and relies on a 6 parameters equations system
- minimalist approach -> possible to use analytical tools to study the model sensitivity and behaviour

Taugourdeau O, Barczy J-F, Caraglio Y. Simulation of Morphogenetical Gradients Using a Minimal Functional-Structural Plant Model (FSPM). In: Kang M., Dumont Y., Guo Y., eds. Plant Growth Modeling, Simulation, Visualization and Applications. Proceedings of PMA12. Shanghai, China: IEEE press; 2012. p. 379-387.

## Lollymangrove

- develop a standardized protocol for describing mangrove stands from forest inventories
- integrate allometric relationships between DBH, crown dimension, tree height and tree biomass to make possible the visualization of lollypop-like mangrove stands
- compute biomass at both the tree and stand scales
- provide a robust and easy-to-use interface allowing data exportation into various formats directly usable by other simulation tools (e.g. the DART model, a 3D radiative transfer model able to simulate optical remote sensing images)
